AI FAQ Assistant API

PHASE 1: REQUIREMENTS AND DESIGN

Objective

Identify project requirements and plan the structure of the AI FAQ Assistant API.

Functional Requirements

The system should accept a question, validate the input, process the request, and return an answer. It should return a clear error message for missing or invalid input.

Software Requirements

Node.js, npm, Visual Studio Code, Express.js, a configured AI provider API, and optionally MongoDB if persistent storage is included.

System Design

Client sends an HTTP request to the Express API. The backend validates the request, sends the prompt to the configured AI service, receives the response, and returns JSON to the client.

Deliverables

Requirement list, API flow design, technology selection, and planned endpoint structure.
