AI FAQ Assistant API

PHASE 3: AI INTEGRATION

Objective

Connect the backend API to an AI model so that it can generate answers to user questions.

Implementation Steps

1. Select and configure the AI provider.
2. Store the API key in an environment file and never expose it in client-side code.
3. Create a service function to send the question to the model.
4. Process the model response and return the answer through the API.
5. Handle timeouts, unavailable services, and invalid responses.

Security

Keep API credentials private, use environment variables, avoid logging secrets, and apply suitable input validation and rate limits.

Expected Result

A question submitted through the API is passed to the configured AI service and its answer is returned to the client.
