AI FAQ Assistant API

FINAL PROJECT REPORT

Abstract

AI FAQ Assistant API is a backend application intended to provide answers to frequently asked questions. It receives questions through an API endpoint, validates the input, communicates with a configured AI model, and returns the response in JSON format.

Problem Statement

Users may need a convenient way to submit questions and receive responses through an application. The project provides an API-based interface for this purpose.

Proposed System

The proposed system uses a Node.js and Express backend with an AI service integration. Optional database storage may be added if the implementation requires saved FAQs, users, or conversation history.

Advantages

Reusable API interface; quick request-response workflow; modular backend design; can be integrated with web or mobile clients.

Limitations

Answer quality depends on the selected AI model, prompt design, provider availability, and network connection. AI-generated answers should be checked for accuracy.

Conclusion

The AI FAQ Assistant API demonstrates how a backend service can accept user questions and return AI-generated responses. Further improvements may include authentication, FAQ management, logging, and deployment.
